TD 2: Temporal Logics

Exercise 1 (Specification). We would like to verify the properties of a boolean circuit with input $x$, output $y$, and two registers $r_1$ and $r_2$. We define accordingly $\text{AP} = \{x, y, r_1, r_2\}$ as our set of atomic propositions and consider the linear time flow $(\mathbb{N}, <)$ where the runs of the circuit can be seen as temporal structures.

Translate the following properties (a) in $\text{TL}(\text{AP}, \text{SU})$ and (b) in $\text{FO}(\text{AP}, <)$:

1. “it is impossible to get two consecutive 1 as output”
2. “each time the input is 1, at most two ticks later the output will be 1”
3. “each time the input is 1, the register contents remain the same over the next tick”
4. “register $r_1$ is infinitely often 1”

Note that there might be several, non-equivalent formal specifications matching these informal descriptions—that’s the whole point of writing specifications!—but your (a) and (b) should be equivalent.

Exercise 2 (Equivalences). We fix a set $\text{AP}$ of atomic propositions including $\{p, q, r\}$ and some discrete linear time flow $(\mathbb{T}, <)$.

1. Show that $\varphi \text{ SU } \psi \equiv X(\psi \lor (\varphi \land (\varphi \text{ SU } \psi)))$.
2. Consider the formulæ $\varphi_1 = G(p \rightarrow X q)$ and $\varphi_2 = G(p \rightarrow ((\neg q) \text{ R } q))$
   (a) Does $\varphi_2$ imply $\varphi_1$?
   (b) Does $\varphi_1$ imply $\varphi_2$?
3. Simplify the following formula:
   $$\text{SF}(((G r) \lor p) \land (\neg q \lor p)) \lor \text{SF}(\neg p \lor F q).$$
4. Give a $\text{TL}(\text{AP}, \text{U})$ formula $\varphi$ equivalent to $(p \lor q) \lor r$ and such that for any sub-formula $\psi \lor \psi'$ of $\varphi$, $\psi$ is a boolean formula.

Exercise 3 (Expressiveness). We fix the set $\text{AP} = \{p\}$ of atomic propositions, with an associated alphabet $\Sigma = \{\{p\}, \emptyset\}$, and consider the $(\mathbb{N}, <)$ flow of time, where temporal structures can be seen as infinite words over $\Sigma$, i.e. words in $\Sigma^\omega$.

1. Show that the following subsets of $\Sigma^\omega$ are expressible in $\text{LTL}(\text{AP}, \text{U}, X)$:
   (a) $\{p\}^* \cdot \emptyset^\omega$, and
(b) \( \{p\}^n \cdot \emptyset^\omega \) for each fixed \( n \geq 0 \).

2. Is the language \( (\{p\} \cdot \emptyset)^\omega \) expressible in \( \text{LTL}(\text{AP}, U, X) \)?

3. Consider the infinite sequence \( \sigma_i = \{p\}^i \cdot \emptyset \cdot \{p\}^\omega \) for \( i \geq 0 \). Show by induction on \( \text{LTL}(\text{AP}, U, X) \) formulae \( \varphi \) that, for all \( n \geq 0 \), if \( \varphi \) has less than \( n \) \( X \) modalities, then for all \( i, i' > n \), \( \sigma_i \models \varphi \) iff \( \sigma_{i'} \models \varphi \). (Hint: For the case of \( U \), show that \( \sigma_n+1 \models \varphi \) iff \( \sigma_{n+1} \models \varphi \).)

4. Using the previous question, show that the set \( (\{p\} \cdot \Sigma)^\omega \) is not expressible in \( \text{LTL}(\text{AP}, U, X) \) over \( (\mathbb{N}, <) \).

Exercise 4 (Linear Orders with Gaps). In this exercise we assume \( (T, <) \) to be a linear time flow. Let us define a new unary “gap” modality \( \text{gap} \):

$$
w, i \models \text{gap} \varphi \text{ iff } \forall k, k > i \rightarrow (\exists \ell, k < \ell \land \forall j, i < j < \ell \rightarrow w, j \models \varphi) \\
\lor (\exists j, i < j < k \land w, j \models \neg \varphi) \\
\land \exists k_1, k_1 > i \land \forall j, i < j \leq k_1 \rightarrow w, j \models \varphi \\
\land \exists k_2, k_2 > i \land w, k_2 \models \neg \varphi .
$$

The intuition behind \( \text{gap} \) is that \( \varphi \) should hold for some time until a gap occurs in the time flow, after which \( \neg \varphi \) holds at points arbitrarily close to the gap.

1. Express \( \text{gap} \varphi \) using the standard \( SU \) modality.

2. Show that, if \( (T, <) \) is Dedekind-complete (i.e. every nonempty subset of \( T \) with an upper bound has a least upper bound), then \( \text{gap} p \) for \( p \in \text{AP} \) cannot be satisfied.
