# Expressivity

Definition: Equivalence

Let  $\mathcal{C}$  be a class of time flows.

Two formulae  $\varphi, \psi \in \text{TL}(\text{AP}, \text{SU}, \text{SS})$  are equivalent over  $\mathcal{C}$  if for all temporal structures  $w = (\mathbb{T}, <, h)$  over  $\mathcal{C}$  and all time points  $t \in \mathbb{T}$  we have

$$w, t \models \varphi \quad \text{iff} \quad w, t \models \psi$$

Two formulae  $\varphi \in \text{TL}(\text{AP}, \text{SU}, \text{SS})$  and  $\psi(x) \in \text{FO}_{\text{AP}}(<)$  are equivalent over  $\mathcal{C}$  if for all temporal structures  $w = (\mathbb{T}, <, h)$  over  $\mathcal{C}$  and all time points  $t \in \mathbb{T}$  we have

$$w, t \models \varphi \quad \text{iff} \quad w, x \mapsto t \models \psi$$

We also write  $w \models \psi(t)$ .

Remark:  $\text{TL}(\text{AP}, \text{SU}, \text{SS}) \subseteq \text{FO}_{\text{AP}}^3(<) \subseteq \text{FO}_{\text{AP}}(<)$

$\forall \varphi \in \text{TL}(\text{AP}, \text{SU}, \text{SS}), \exists \psi(x) \in \text{FO}_{\text{AP}}^3(<)$  such that  $\varphi$  and  $\psi(x)$  are equivalent.

Expressivity problem:

LTL = FO?

# Expressivity

Definition: complete linear time flows

A time flow  $(\mathbb{T}, <)$  is **linear** if  $<$  is a **total** strict order.

A linear time flow  $(\mathbb{T}, <)$  is **complete** if every **nonempty and bounded** subset of  $\mathbb{T}$  has a **least upper bound** and a **greatest lower bound**.

$(\mathbb{N}, <)$ ,  $(\mathbb{Z}, <)$  and  $(\mathbb{R}, <)$  are complete.

$(\mathbb{Q}, <)$  and  $(\mathbb{R} \setminus \{0\}, <)$  are **not** complete.

Theorem: Expressive completeness [11, Kamp 68]

For **complete** linear time flows,  $\text{TL}(\text{AP}, \text{SU}, \text{SS}) = \text{FO}_{\text{AP}}(<)$

Elegant algebraic proof of  $\text{TL}(\text{AP}, \text{SU}) = \text{FO}_{\text{AP}}(<)$  over  $(\mathbb{N}, <)$  due to Wilke 98.

See also Diekert-Gastin [17]:  $\text{TL} = \text{FO} = \text{SF} = \text{AP} = \text{CFBA} = \text{VWAA}$ .

Example: Translate in  $\text{TL}(\text{AP}, \text{SU}, \text{SS})$  (1)

$$\psi(x) = \neg P_a(x) \wedge \neg P_b(x) \wedge \forall y \forall z (P_a(y) \wedge P_b(z) \wedge y < z) \rightarrow \exists v y < v < z \wedge \begin{pmatrix} P_c(v) \wedge x < y \\ \vee P_d(v) \wedge z < x \\ \vee P_e(v) \wedge y < x < z \end{pmatrix}$$

# Stavi connectives: Time flows with gaps

Definition: Stavi Until:  $\bar{U}$

Let  $w = (\mathbb{T}, <, h)$  be a temporal structure and  $i \in \mathbb{T}$ . Then,  $w, i \models \varphi \bar{U} \psi$  if

$\exists k i < k$

$$\wedge \exists j (i < j < k \wedge w, j \models \neg \varphi)$$

$$\wedge \exists j (i < j < k \wedge \forall \ell (i < \ell < j \rightarrow w, \ell \models \varphi))$$

$$\wedge \forall j \left[ i < j < k \rightarrow \left[ \exists k' [j < k' \wedge \forall j' (i < j' < k' \rightarrow w, j' \models \varphi)] \vee [\forall \ell (j < \ell < k \rightarrow w, \ell \models \psi) \wedge \exists \ell (i < \ell < j \wedge w, \ell \models \neg \varphi)] \right] \right]$$

Similar definition for the Stavi Since  $\bar{S}$ .

Example: (2)

• Let  $w = (\mathbb{R} \setminus \{0\}, <, h)$  with  $h(p) = \mathbb{R}_-$  and  $h(q) = \mathbb{R}_+$ .

Then,  $w, -1 \not\models p \text{SU} q$  but  $w, -1 \models p \bar{U} q$ .

• Let  $w' = (\mathbb{R} \setminus \{0\}, <, h')$  with  $h'(p) = \mathbb{R} \setminus \{1, \frac{1}{2}, \frac{1}{4}, \dots, 0\}$  and  $h'(q) = \mathbb{R}_+$ .

Then,  $w', -1 \models p \bar{U} q$ .

## Stavi connectives: Time flows with gaps

Theorem: [13, Gabbay, Hodkinson, Reynolds]

$TL(AP, SU, SS, \bar{S}, \bar{U})$  is expressively complete for  $FO_{AP}(<)$  over the class of all linear time flows.

Exercise: Isolated gaps (3)

Let  $\varphi_p = p \text{ SU } p \wedge \text{ SF } \neg p \wedge \neg(p \text{ SU } \neg p) \wedge \neg(p \text{ SU } \neg(p \text{ SU } \top))$ .

Let  $w = (\mathbb{T}, <, h)$  with  $\mathbb{T} \subseteq \mathbb{R}$  and  $t \in \mathbb{T}$ .

Show that if  $w, t \models \varphi_p$  then  $\mathbb{T}$  has a gap.

Let  $\psi_{p,q} = \varphi_p \wedge (q \vee \varphi_p) \text{ SU } (q \wedge \neg p)$ .

Show that  $\psi_{p,q}$  is equivalent to  $p \bar{U} q$  over the time flow  $(\mathbb{R} \setminus \{0\}, <)$ .

Show that  $TL(AP, SU, SS)$  is  $FO_{AP}(<)$ -complete over the time flow  $(\mathbb{R} \setminus \mathbb{Z}, <)$ .

## Temporal depth

Definition: Temporal depth of  $\varphi \in TL(AP, SU, SS)$

$$\begin{aligned} \text{td}(p) &= 0 && \text{if } p \in AP \\ \text{td}(\neg\varphi) &= \text{td}(\varphi) \\ \text{td}(\varphi \vee \psi) &= \max(\text{td}(\varphi), \text{td}(\psi)) \\ \text{td}(\varphi \text{ SS } \psi) &= \max(\text{td}(\varphi), \text{td}(\psi)) + 1 \\ \text{td}(\varphi \text{ SU } \psi) &= \max(\text{td}(\varphi), \text{td}(\psi)) + 1 \end{aligned}$$

Lemma:

Let  $B \subseteq AP$  be finite and  $k \in \mathbb{N}$ .

There are (up to equivalence) finitely many formulae in  $TL(B, SU, SS)$  of temporal depth at most  $k$ .

## $k$ -equivalence

Definition:

Let  $w_0 = (\mathbb{T}_0, <, h_0)$  and  $w_1 = (\mathbb{T}_1, <, h_1)$  be two temporal structures. Let  $i_0 \in \mathbb{T}_0$  and  $i_1 \in \mathbb{T}_1$ . Let  $k \in \mathbb{N}$ .

We say that  $(w_0, i_0)$  and  $(w_1, i_1)$  are  $k$ -equivalent, denoted  $(w_0, i_0) \equiv_k (w_1, i_1)$ , if they satisfy the same formulae in  $TL(AP, SU, SS)$  of temporal depth at most  $k$ .

Lemma:  $\equiv_k$  is an equivalence relation of finite index.

Example:

Let  $a = \{p\}$  and  $b = \{q\}$ . Let  $w_0 = \text{babaababaa}$  and  $w_1 = \text{baababaaba}$ .

$$\begin{aligned} (w_0, 3) &\equiv_0 (w_1, 4) \\ (w_0, 3) &\equiv_1 (w_1, 4) ? \\ (w_0, 3) &\equiv_1 (w_1, 6) ? \end{aligned}$$

Here,  $\mathbb{T}_0 = \mathbb{T}_1 = \{0, 1, 2, \dots, 9\}$ .

## EF-games for $TL(AP, SU, SS)$

The EF-game has two players: **Spoiler (Player I)** and **Duplicator (Player II)**.

The **game board** consists of 2 temporal structures:

$w_0 = (\mathbb{T}_0, <, h_0)$  and  $w_1 = (\mathbb{T}_1, <, h_1)$ .

There are **two tokens**, one on each structure:  $i_0 \in \mathbb{T}_0$  and  $i_1 \in \mathbb{T}_1$ .

A **configuration** is a tuple  $(w_0, i_0, w_1, i_1)$

or simply  $(i_0, i_1)$  if the game board is understood.

Let  $k \in \mathbb{N}$ .

The  **$k$ -round EF-game** from a configuration proceeds with (at most)  $k$  moves.

There are 2 available moves for  $TL(AP, SU, SS)$ : **SU-move** or **SS-move** (see below).

Spoiler chooses which move is played in each round.

**Spoiler wins** if

- ▶ Either **duplicator cannot answer** during a move (see below).
- ▶ Or a configuration such that  $(w_0, i_0) \not\equiv_0 (w_1, i_1)$  is reached.

Otherwise, **duplicator wins**.

## Strict Until and Since moves

### Definition: SU-move

- ▶ Spoiler chooses  $\varepsilon \in \{0, 1\}$  and  $k_\varepsilon \in \mathbb{T}_\varepsilon$  such that  $i_\varepsilon < k_\varepsilon$ .
- ▶ Duplicator chooses  $k_{1-\varepsilon} \in \mathbb{T}_{1-\varepsilon}$  such that  $i_{1-\varepsilon} < k_{1-\varepsilon}$ .  
**Spoiler wins if there is no such  $k_{1-\varepsilon}$ .**  
**Either spoiler chooses  $(k_0, k_1)$  as next configuration of the EF-game,**  
**or the move continues as follows**
- ▶ Spoiler chooses  $j_{1-\varepsilon} \in \mathbb{T}_{1-\varepsilon}$  with  $i_{1-\varepsilon} < j_{1-\varepsilon} < k_{1-\varepsilon}$ .
- ▶ Duplicator chooses  $j_\varepsilon \in \mathbb{T}_\varepsilon$  with  $i_\varepsilon < j_\varepsilon < k_\varepsilon$ .  
**Spoiler wins if there is no such  $j_\varepsilon$ .**  
**The next configuration is  $(j_0, j_1)$ .**

Similar definition for the SS-move.

## Winning strategy

### Definition: Winning strategy

**Duplicator has a winning strategy** in the  $k$ -round EF-game starting from  $(w_0, i_0, w_1, i_1)$  if he can win all plays starting from this configuration. This is denoted by  $(w_0, i_0) \sim_k (w_1, i_1)$ .

**Spoiler has a winning strategy** in the  $k$ -round EF-game starting from  $(w_0, i_0, w_1, i_1)$  if she can win all plays starting from this configuration.

### Example:

(4)

Let  $a = \{p\}$ ,  $b = \{q\}$ ,  $c = \{r\}$ . Let  $w_0 = aaaabbc$  and  $w_1 = aaababc$ .

$$(w_0, 0) \sim_1 (w_1, 0)$$

$$(w_0, 0) \not\sim_2 (w_1, 0)$$

Here,  $\mathbb{T}_0 = \mathbb{T}_1 = \{0, 1, 2, \dots, 5\}$ .

## EF-games for TL(AP, SU, SS)

### Lemma: Determinacy

The  $k$ -round EF-game for TL(AP, SU, SS) is determined:  
 For each initial configuration, either spoiler or duplicator has a winning strategy.

### Theorem: Soundness and completeness of EF-games

For all  $k \in \mathbb{N}$  and all configurations  $(w_0, i_0, w_1, i_1)$ , we have

$$(w_0, i_0) \sim_k (w_1, i_1) \text{ iff } (w_0, i_0) \equiv_k (w_1, i_1)$$

### Example:

Let  $a = \{p\}$ ,  $b = \{q\}$ ,  $c = \{r\}$ .

Then,  $aaaabbc, 0 \models p \text{ SU } (q \text{ SU } r)$  but  $aaababc, 0 \not\models p \text{ SU } (q \text{ SU } r)$ .

$p \text{ SU } (q \text{ SU } r)$  cannot be expressed with a formula of temporal depth at most 1.

$p \text{ SU } (q \wedge X q)$  cannot be expressed with a formula of temporal depth at most 1.

### Exercise:

On finite linear time flows, "even length" cannot be expressed in TL(AP, SU, SS).

## Moves for Strict Future and Past modalities

### Definition: SF-move

- ▶ Spoiler chooses  $\varepsilon \in \{0, 1\}$  and  $j_\varepsilon \in \mathbb{T}_\varepsilon$  such that  $i_\varepsilon < j_\varepsilon$ .
- ▶ Duplicator chooses  $j_{1-\varepsilon} \in \mathbb{T}_{1-\varepsilon}$  such that  $i_{1-\varepsilon} < j_{1-\varepsilon}$ .  
**Spoiler wins if there is no such  $j_{1-\varepsilon}$ .**  
**The new configuration is  $(j_0, j_1)$ .**

Similar definition for the SP-move.

### Example:

$p \text{ SU } q$  is not expressible in TL(AP, SP, SF) over linear flows of time.

Let  $a = \emptyset$ ,  $b = \{p\}$  and  $c = \{q\}$ .

Let  $w_0 = (abc)^n a (abc)^n$  and  $w_1 = (abc)^n (abc)^n$ .

If  $n > k$  then, starting from  $(w_0, 3n, w_1, 3n)$ , duplicator has a winning strategy in the  $k$ -round EF-game using SF-moves and SP-moves.

## Moves for Next and Yesterday modalities

Notation:  $i < j \stackrel{\text{def}}{=} i < j \wedge \neg \exists k (i < k < j)$ .

### Definition: X-move

- ▶ Spoiler chooses  $\varepsilon \in \{0, 1\}$  and  $j_\varepsilon \in \mathbb{T}_\varepsilon$  such that  $i_\varepsilon < j_\varepsilon$ .
- ▶ Duplicator chooses  $j_{1-\varepsilon} \in \mathbb{T}_{1-\varepsilon}$  such that  $i_{1-\varepsilon} < j_{1-\varepsilon}$ .  
Spoiler wins if there is no such  $j_{1-\varepsilon}$ .  
The new configuration is  $(j_0, j_1)$ .

Similar definition for the Y-move.

### Exercise:

Show that  $p \text{ SU } q$  is not expressible in  $\text{TL}(\text{AP}, \text{Y}, \text{SP}, \text{X}, \text{SF})$  over linear time flows.

## Non-strict Until and Since moves

### Definition: U-move

- ▶ Spoiler chooses  $\varepsilon \in \{0, 1\}$  and  $k_\varepsilon \in \mathbb{T}_\varepsilon$  such that  $i_\varepsilon \leq k_\varepsilon$ .
  - ▶ Duplicator chooses  $k_{1-\varepsilon} \in \mathbb{T}_{1-\varepsilon}$  such that  $i_{1-\varepsilon} \leq k_{1-\varepsilon}$ .  
Either spoiler chooses  $(k_0, k_1)$  as new configuration of the EF-game, or the move continues as follows
  - ▶ Spoiler chooses  $j_{1-\varepsilon} \in \mathbb{T}_{1-\varepsilon}$  with  $i_{1-\varepsilon} \leq j_{1-\varepsilon} < k_{1-\varepsilon}$ .
  - ▶ Duplicator chooses  $j_\varepsilon \in \mathbb{T}_\varepsilon$  with  $i_\varepsilon \leq j_\varepsilon < k_\varepsilon$ .  
Spoiler wins if there is no such  $j_\varepsilon$ .  
The new configuration is  $(j_0, j_1)$ .
- ▶ If duplicator chooses  $k_{1-\varepsilon} = i_{1-\varepsilon}$  then the new configuration must be  $(k_0, k_1)$ .
  - ▶ If spoiler chooses  $k_\varepsilon = i_\varepsilon$  then duplicator must choose  $k_{1-\varepsilon} = i_{1-\varepsilon}$ , otherwise he loses.

Similar definition for the S-move.

### Exercise:

1. Show that SU is not expressible in  $\text{TL}(\text{AP}, \text{S}, \text{U})$  over  $(\mathbb{R}, <)$ .
2. Show that SU is not expressible in  $\text{TL}(\text{AP}, \text{S}, \text{U})$  over  $(\mathbb{N}, <)$ .

## Syntactic Separation

### Definition: Syntactically pure formulae and separation

A formula  $\varphi \in \text{TL}(\text{AP}, \text{SU}, \text{SS})$  is

- ▶ **syntactically pure present** if it is a boolean combination of formulae in AP,
- ▶ **syntactically pure future** if it is a boolean combination of formulae of the form  $\alpha \text{ SU } \beta$  where  $\alpha, \beta \in \text{TL}(\text{AP}, \text{SU})$ ,
- ▶ **syntactically pure past** if it is a boolean combination of formulae of the form  $\alpha \text{ SS } \beta$  where  $\alpha, \beta \in \text{TL}(\text{AP}, \text{SS})$ .
- ▶ **syntactically separated** if it is a boolean combination of syntactically pure formulae.

A logic  $\mathcal{L}$  is **syntactically separable** over a class  $\mathcal{C}$  of time flows if each formula  $\varphi \in \mathcal{L}$  is equivalent to some (finite) **boolean combination of syntactically pure formulae**.

### Example:

(5)

The formulae  $\varphi_1 = \text{SF}(q \wedge \text{SP } p)$  and  $\varphi_2 = \text{SF}(q \wedge \neg \text{SP } \neg p)$  are not separated but we can find equivalent syntactically separated formulae.

## Separation

### Theorem: [8, Gabbay, Pnueli, Shelah & Stavri 80]

$\text{TL}(\text{AP}, \text{SU}, \text{SS})$  is syntactically separable over discrete and complete linear orders.

### Definition: Discrete linear order

A linear time flow  $(\mathbb{T}, <)$  is **discrete** if every non-maximal element has an immediate successor and every non-minimal element has an immediate predecessor.

- ▶  $(\mathbb{N}, <)$  is the unique (up to isomorphism) discrete and complete linear order with a first point and no last point.
- ▶  $(\mathbb{Z}, <)$  is the unique (up to isomorphism) discrete and complete linear order with no first point and no last point.
- ▶ Any discrete and complete linear order is isomorphic to a sub-flow of  $(\mathbb{Z}, <)$ .

### Theorem: Gabbay, Reynolds, see [7]

$\text{TL}(\text{AP}, \text{SU}, \text{SS})$  is syntactically separable over  $(\mathbb{R}, <)$ .

## Semantic Separation

### Definition:

Let  $w = (\mathbb{T}, <, h)$  and  $w' = (\mathbb{T}, <, h')$  be temporal structures over the same time flow, and let  $t \in \mathbb{T}$  be a time point.

- ▶  $w, w'$  agree **on  $t$**  if  $\ell(t) = \ell'(t)$
- ▶  $w, w'$  agree **on the past of  $t$**  if  $\ell(s) = \ell'(s)$  for all  $s < t$
- ▶  $w, w'$  agree **on the future of  $t$**  if  $\ell(s) = \ell'(s)$  for all  $s > t$

Recall:  $h: AP \rightarrow 2^{\mathbb{T}}$  and  $\ell: \mathbb{T} \rightarrow 2^{AP}$  with  $\ell(t) = \{p \in AP \mid t \in h(p)\}$ .

### Definition: Pure formulae

Let  $\mathcal{C}$  be a class of time flows. A formula  $\varphi$  over some logic  $\mathcal{L}$  is **pure past** (resp. **pure present**, **pure future**) over  $\mathcal{C}$  if

$$w, t \models \varphi \quad \text{iff} \quad w', t \models \varphi$$

for all temporal structures  $w = (\mathbb{T}, <, h)$  and  $w' = (\mathbb{T}, <, h')$  over  $\mathcal{C}$  and all time points  $t \in \mathbb{T}$  such that

$$w, w' \text{ agree on the past of } t \text{ (resp. on } t, \text{ on the future of } t).$$

## Separation

### Remark: Syntax versus semantic

Every formula  $\varphi \in \text{TL}(AP, SU, SS)$  which is **syntactically pure** present (resp. future, past) is also **semantically pure** present (resp. future, past).

### Definition: Separation

A logic  $\mathcal{L}$  is **separable** over a class  $\mathcal{C}$  of time flows if each formula  $\varphi \in \mathcal{L}$  is equivalent to some (finite) **boolean combination of pure formulae**.

### Theorem: [12, Gabbay 89] (already stated by Gabbay in 81)

Let  $\mathcal{C}$  be a class of linear time flows.

Let  $\mathcal{L}$  be a temporal logic able to express SF and SP.

**Then,  $\mathcal{L}$  is separable over  $\mathcal{C}$  iff it is expressively complete for  $\text{FO}_{AP}(<)$  over  $\mathcal{C}$ .**

### Exercise: Checking semantically pure

Is the following problem decidable? If yes, what is his complexity?

**Input:** A formula  $\varphi \in \text{TL}(AP, SU, SS)$

**Question:** Is the formula  $\varphi$  *semantically pure future*?

## Initial equivalence

### Definition: Initial Equivalence

Let  $\mathcal{C}$  be a class of time flows having a least element (denoted 0). Two formulae  $\varphi, \psi \in \text{TL}(AP, SU, SS)$  are **initially equivalent** over  $\mathcal{C}$  if for all temporal structures  $w = (\mathbb{T}, <, h)$  over  $\mathcal{C}$  we have

$$w, 0 \models \varphi \quad \text{iff} \quad w, 0 \models \psi$$

Two formulae  $\varphi \in \text{TL}(AP, SU, SS)$  and  $\psi(x) \in \text{FO}_{AP}(<)$  are **initially equivalent** over  $\mathcal{C}$  if for all temporal structures  $w = (\mathbb{T}, <, h)$  over  $\mathcal{C}$  we have

$$w, 0 \models \varphi \quad \text{iff} \quad w \models \psi(0)$$

### Corollary: of the separation theorem

For each  $\varphi \in \text{TL}(AP, SU, SS)$  there exists  $\psi \in \text{TL}(AP, SU)$  such that  $\varphi$  and  $\psi$  are initially equivalent over  $(\mathbb{N}, <)$ .

## Initial equivalence

### Example: $\text{TL}(AP, SU, SS)$ versus $\text{TL}(AP, SU)$

$$G(\text{grant} \rightarrow (\neg \text{grant } SS \text{ request}))$$

is initially equivalent to

$$(\text{request } R \neg \text{grant}) \wedge G(\text{grant} \rightarrow (\text{request} \vee (\text{request } SR \neg \text{grant})))$$

### Theorem: (Laroussinie & Markey & Schnoebelen 2002)

$\text{TL}(AP, SU, SS)$  may be exponentially more succinct than  $\text{TL}(AP, SU)$  over  $(\mathbb{N}, <)$ .
