# Adding types to $\lambda$ -calculus

- ▶ The basic  $\lambda$ -calculus is untyped
- ▶ The first functional programming language, LISP, was also untyped
- ▶ Modern languages such as Haskell, ML, ... are strongly typed
- ▶ What is the theoretical foundation for such languages?

# Types in functional programming

The structure of types in Haskell

- ▶ Basic types—`Int`, `Bool`, `Float`, `Char`

# Types in functional programming

The structure of types in Haskell

- ▶ Basic types—`Int`, `Bool`, `Float`, `Char`

- ▶ Structured types

  - [Lists] If `a` is a type, so is `[a]`

  - [Tuples] If `a1`, `a2`, ..., `ak` are types, so is  
`(a1,a2,...,ak)`

# Types in functional programming

The structure of types in Haskell

- ▶ Basic types—`Int`, `Bool`, `Float`, `Char`

- ▶ Structured types

  - `[Lists]` If `a` is a type, so is `[a]`

  - `[Tuples]` If `a1`, `a2`, ..., `ak` are types, so is  
`(a1,a2,...,ak)`

- ▶ Function types

  - ▶ If `a`, `b` are types, so is `a -> b`

  - ▶ Function with input `a`, output `b`

# Types in functional programming

The structure of types in Haskell

- ▶ Basic types—`Int`, `Bool`, `Float`, `Char`

- ▶ Structured types

  - `[Lists]` If `a` is a type, so is `[a]`

  - `[Tuples]` If `a1`, `a2`, ..., `ak` are types, so is  
`(a1,a2,...,ak)`

- ▶ Function types

  - ▶ If `a`, `b` are types, so is `a -> b`

  - ▶ Function with input `a`, output `b`

- ▶ User defined types

  - ▶ `Data day = Sun | Mon | Tue | Wed | Thu | Fri | Sat`

  - ▶ `Data BTree a = Nil | Node (BTree a) a (Btree a)`

# Adding types to $\lambda$ -calculus ...

- Set  $\Lambda$  of untyped lambda expressions is given by

$$\Lambda = x \mid \lambda x.M \mid MM'$$

where  $x \in Var$ ,  $M, M' \in \Lambda$ .

# Adding types to $\lambda$ -calculus . . .

- ▶ Set  $\Lambda$  of untyped lambda expressions is given by

$$\Lambda = x \mid \lambda x.M \mid MM'$$

where  $x \in \text{Var}$ ,  $M, M' \in \Lambda$ .

- ▶ Add a syntax for basic types
- ▶ When constructing expressions, build up the type from the types of the parts

# Adding types to $\lambda$ -calculus ...

- ▶ Restrict our language to have just one basic type, written as  $\tau$

# Adding types to $\lambda$ -calculus ...

- ▶ Restrict our language to have just one basic type, written as  $\tau$
- ▶ No structured types (lists, tuples, ...)

# Adding types to $\lambda$ -calculus ...

- ▶ Restrict our language to have just one basic type, written as  $\tau$
- ▶ No structured types (lists, tuples, ...)
- ▶ Function types arise naturally ( $\tau \rightarrow \tau$ ,  $(\tau \rightarrow \tau) \rightarrow \tau \rightarrow \tau$ , ...)

# “Simply typed” $\lambda$ -calculus

A separate set of variables  $Var_s$  for each type  $s$

# “Simply typed” $\lambda$ -calculus

A separate set of variables  $Var_s$  for each type  $s$

Define  $\Lambda_s$ , expressions of type  $s$ , by mutual recursion

# “Simply typed” $\lambda$ -calculus

A separate set of variables  $Var_s$  for each type  $s$

Define  $\Lambda_s$ , expressions of type  $s$ , by mutual recursion

- ▶ For each type  $s$ , every variable  $x \in Var_s$  is in  $\Lambda_s$

# “Simply typed” $\lambda$ -calculus

A separate set of variables  $Var_s$  for each type  $s$

Define  $\Lambda_s$ , expressions of type  $s$ , by mutual recursion

- ▶ For each type  $s$ , every variable  $x \in Var_s$  is in  $\Lambda_s$
- ▶ If  $M \in \Lambda_t$  and  $x \in Var_s$  then  $(\lambda x.M) \in \Lambda_{s \rightarrow t}$ .

# “Simply typed” $\lambda$ -calculus

A separate set of variables  $Var_s$  for each type  $s$

Define  $\Lambda_s$ , expressions of type  $s$ , by mutual recursion

- ▶ For each type  $s$ , every variable  $x \in Var_s$  is in  $\Lambda_s$
- ▶ If  $M \in \Lambda_t$  and  $x \in Var_s$  then  $(\lambda x.M) \in \Lambda_{s \rightarrow t}$ .
- ▶ If  $M \in \Lambda_{s \rightarrow t}$  and  $N \in \Lambda_s$  then  $(MN) \in \Lambda_t$ .
  - ▶ Note that application **must** be well typed

# “Simply typed” $\lambda$ -calculus

A separate set of variables  $Var_s$  for each type  $s$

Define  $\Lambda_s$ , expressions of type  $s$ , by mutual recursion

- ▶ For each type  $s$ , every variable  $x \in Var_s$  is in  $\Lambda_s$
- ▶ If  $M \in \Lambda_t$  and  $x \in Var_s$  then  $(\lambda x.M) \in \Lambda_{s \rightarrow t}$ .
- ▶ If  $M \in \Lambda_{s \rightarrow t}$  and  $N \in \Lambda_s$  then  $(MN) \in \Lambda_t$ .
  - ▶ Note that application **must** be well typed

$\beta$  rule as usual

- ▶  $(\lambda x.M)N \rightarrow_\beta M\{x \leftarrow N\}$

# “Simply typed” $\lambda$ -calculus

A separate set of variables  $Var_s$  for each type  $s$

Define  $\Lambda_s$ , expressions of type  $s$ , by mutual recursion

- ▶ For each type  $s$ , every variable  $x \in Var_s$  is in  $\Lambda_s$
- ▶ If  $M \in \Lambda_t$  and  $x \in Var_s$  then  $(\lambda x.M) \in \Lambda_{s \rightarrow t}$ .
- ▶ If  $M \in \Lambda_{s \rightarrow t}$  and  $N \in \Lambda_s$  then  $(MN) \in \Lambda_t$ .
  - ▶ Note that application **must** be well typed

$\beta$  rule as usual

- ▶  $(\lambda x.M)N \rightarrow_\beta M\{x \leftarrow N\}$
- ▶ We must have  $\lambda x.M \in \Lambda_{s \rightarrow t}$  and  $N \in \Lambda_s$  for some types  $s, t$

# “Simply typed” $\lambda$ -calculus

A separate set of variables  $Var_s$  for each type  $s$

Define  $\Lambda_s$ , expressions of type  $s$ , by mutual recursion

- ▶ For each type  $s$ , every variable  $x \in Var_s$  is in  $\Lambda_s$
- ▶ If  $M \in \Lambda_t$  and  $x \in Var_s$  then  $(\lambda x.M) \in \Lambda_{s \rightarrow t}$ .
- ▶ If  $M \in \Lambda_{s \rightarrow t}$  and  $N \in \Lambda_s$  then  $(MN) \in \Lambda_t$ .
  - ▶ Note that application **must** be well typed

$\beta$  rule as usual

- ▶  $(\lambda x.M)N \rightarrow_\beta M\{x \leftarrow N\}$
- ▶ We must have  $\lambda x.M \in \Lambda_{s \rightarrow t}$  and  $N \in \Lambda_s$  for some types  $s, t$
- ▶ Moreover, if  $\lambda x.M \in \Lambda_{s \rightarrow t}$ , then  $x \in Var_s$ , so  $x$  and  $N$  are compatible

## “Simply typed” $\lambda$ -calculus . . .

- ▶ Extend  $\rightarrow_{\beta}$  to one-step reduction  $\rightarrow$ , as usual

## “Simply typed” $\lambda$ -calculus . . .

- ▶ Extend  $\rightarrow_{\beta}$  to one-step reduction  $\rightarrow$ , as usual
- ▶ The reduction relation  $\rightarrow^*$  is Church-Rosser

# “Simply typed” $\lambda$ -calculus . . .

- ▶ Extend  $\rightarrow_{\beta}$  to one-step reduction  $\rightarrow$ , as usual
- ▶ The reduction relation  $\rightarrow^*$  is Church-Rosser
- ▶ In fact,  $\rightarrow^*$  satisfies a much stronger property

# Strong normalization

A  $\lambda$ -expression is

- ▶ **normalizing** if it has a normal form.

# Strong normalization

A  $\lambda$ -expression is

- ▶ **normalizing** if it has a normal form.
- ▶ **strongly normalizing** if every reduction sequence leads to a normal form

# Strong normalization

A  $\lambda$ -expression is

- ▶ **normalizing** if it has a normal form.
- ▶ **strongly normalizing** if every reduction sequence leads to a normal form

Examples

- ▶  $(\lambda x.xx)(\lambda x.xx)$  is not normalizing

# Strong normalization

A  $\lambda$ -expression is

- ▶ **normalizing** if it has a normal form.
- ▶ **strongly normalizing** if every reduction sequence leads to a normal form

Examples

- ▶  $(\lambda x.xx)(\lambda x.xx)$  is not normalizing
- ▶  $(\lambda yz.z)((\lambda x.xx)(\lambda x.xx))$  is not strongly normalizing.

# Strong normalization ...

A  $\lambda$ -calculus is strongly normalizing if every term in the calculus is strongly normalizing

# Strong normalization ...

A  $\lambda$ -calculus is strongly normalizing if every term in the calculus is strongly normalizing

## Theorem

*The simply typed  $\lambda$ -calculus is strongly normalizing*

# Strong normalization ...

A  $\lambda$ -calculus is strongly normalizing if every term in the calculus is strongly normalizing

## Theorem

*The simply typed  $\lambda$ -calculus is strongly normalizing*

## Proof intuition

- ▶ Each  $\beta$ -reduction reduces the type complexity of the term
- ▶ Cannot have an infinite sequence of reductions

# Type checking

- ▶ Syntax of simply typed  $\lambda$ -calculus permits only well-typed terms

# Type checking

- ▶ Syntax of simply typed  $\lambda$ -calculus permits only well-typed terms
- ▶ Converse question; Given an arbitrary term, is it well-typed?

# Type checking

- ▶ Syntax of simply typed  $\lambda$ -calculus permits only well-typed terms
- ▶ Converse question; Given an arbitrary term, is it well-typed?
  - ▶ For instance, we cannot assign a valid type to  $f\ f \dots$
  - ▶  $\dots$  so  $f\ f$  is not a valid expression in this calculus

# Type checking

- ▶ Syntax of simply typed  $\lambda$ -calculus permits only well-typed terms
- ▶ Converse question; Given an arbitrary term, is it well-typed?
  - ▶ For instance, we cannot assign a valid type to  $f\ f \dots$
  - ▶  $\dots$  so  $f\ f$  is not a valid expression in this calculus

## Theorem

*The type-checking problem for the simply typed  $\lambda$ -calculus is decidable*

# Type checking ...

- ▶ A term may admit multiple types
  - ▶  $\lambda x.x$  can be of type  $\tau \rightarrow \tau$ ,  $(\tau \rightarrow \tau) \rightarrow (\tau \rightarrow \tau)$ , ...

# Type checking ...

- ▶ A term may admit multiple types
  - ▶  $\lambda x.x$  can be of type  $\tau \rightarrow \tau$ ,  $(\tau \rightarrow \tau) \rightarrow (\tau \rightarrow \tau)$ , ...
- ▶ **Principal type scheme** of a term  $M$  — unique type  $s$  such that every other valid type is an “instance” of  $s$ 
  - ▶ Uniformly replace  $\tau \in s$  by another type

# Type checking ...

- ▶ A term may admit multiple types
  - ▶  $\lambda x.x$  can be of type  $\tau \rightarrow \tau$ ,  $(\tau \rightarrow \tau) \rightarrow (\tau \rightarrow \tau)$ , ...
- ▶ **Principal type scheme** of a term  $M$  — unique type  $s$  such that every other valid type is an “instance” of  $s$ 
  - ▶ Uniformly replace  $\tau \in s$  by another type
  - ▶  $\tau \rightarrow \tau$  is principal type scheme of  $\lambda x.x$

# Type checking ...

- ▶ A term may admit multiple types
  - ▶  $\lambda x.x$  can be of type  $\tau \rightarrow \tau$ ,  $(\tau \rightarrow \tau) \rightarrow (\tau \rightarrow \tau)$ , ...
- ▶ **Principal type scheme** of a term  $M$  — unique type  $s$  such that every other valid type is an “instance” of  $s$ 
  - ▶ Uniformly replace  $\tau \in s$  by another type
  - ▶  $\tau \rightarrow \tau$  is principal type scheme of  $\lambda x.x$

## Theorem

*We can always compute the principal type scheme for any well-typed term in the simply typed  $\lambda$ -calculus.*

# Computability with simple types

- ▶ Church numerals are well typed

# Computability with simple types

- ▶ Church numerals are well typed
- ▶ Translations of basic recursive functions (**zero**, **successor**, **projection**) are well-typed

# Computability with simple types

- ▶ Church numerals are well typed
- ▶ Translations of basic recursive functions (**zero**, **successor**, **projection**) are well-typed
- ▶ Translation of **function composition** is well typed

# Computability with simple types

- ▶ Church numerals are well typed
- ▶ Translations of basic recursive functions (**zero**, **successor**, **projection**) are well-typed
- ▶ Translation of **function composition** is well typed
- ▶ Translation of **primitive recursion** is well typed

# Computability with simple types

- ▶ Church numerals are well typed
- ▶ Translations of basic recursive functions (**zero**, **successor**, **projection**) are well-typed
- ▶ Translation of **function composition** is well typed
- ▶ Translation of **primitive recursion** is well typed
- ▶ Translation of **minimalization** requires elimination of recursive definitions
  - ▶ Uses untypable expressions of the form  $f\ f$

# Computability with simple types

- ▶ Church numerals are well typed
- ▶ Translations of basic recursive functions (**zero**, **successor**, **projection**) are well-typed
- ▶ Translation of **function composition** is well typed
- ▶ Translation of **primitive recursion** is well typed
- ▶ Translation of **minimalization** requires elimination of recursive definitions
  - ▶ Uses untypable expressions of the form  $f\ f$
- ▶ Minimalization introduces non terminating computations, but we have strong normalization!

# Computability with simple types

- ▶ Church numerals are well typed
- ▶ Translations of basic recursive functions (**zero**, **successor**, **projection**) are well-typed
- ▶ Translation of **function composition** is well typed
- ▶ Translation of **primitive recursion** is well typed
- ▶ Translation of **minimalization** requires elimination of recursive definitions
  - ▶ Uses untypable expressions of the form  $f\ f$
- ▶ Minimalization introduces non terminating computations, but we have strong normalization!
- ▶ However, there do exist total recursive functions that are not primitive recursive — e.g. Ackermann's function

# Polymorphism

- ▶ Simply typed  $\lambda$ -calculus has explicit types

# Polymorphism

- ▶ Simply typed  $\lambda$ -calculus has explicit types
- ▶ Languages like Haskell have polymorphic types
  - ▶ Compare `id :: a -> a`  
with  $\lambda x.x : \tau \rightarrow \tau$

# Polymorphism

- ▶ Simply typed  $\lambda$ -calculus has explicit types
- ▶ Languages like Haskell have polymorphic types
  - ▶ Compare `id :: a -> a`  
with  $\lambda x.x : \tau \rightarrow \tau$
- ▶ Second-order polymorphic typed lambda calculus (System F)
  - ▶ Jean-Yves Girard
  - ▶ John Reynolds

# System F

- ▶ Add type variables,  $a$ ,  $b$ ,  $\dots$

# System F

- ▶ Add type variables,  $a, b, \dots$
- ▶ Use  $i, j, \dots$  to denote concrete types

# System F

- ▶ Add type variables,  $a, b, \dots$
- ▶ Use  $i, j, \dots$  to denote concrete types
- ▶ Type schemes

$$s ::= a \mid i \mid s \rightarrow s \mid \forall a. s$$

# System F

Syntax of second order polymorphic lambda calculus

- ▶ Every variable and (type) constant is a term.

# System F

## Syntax of second order polymorphic lambda calculus

- ▶ Every variable and (type) constant is a term.
- ▶ If  $M$  is a term,  $x$  is a variable and  $s$  is a type scheme, then  $(\lambda x \in s. M)$  is a term.

# System F

## Syntax of second order polymorphic lambda calculus

- ▶ Every variable and (type) constant is a term.
- ▶ If  $M$  is a term,  $x$  is a variable and  $s$  is a type scheme, then  $(\lambda x \in s. M)$  is a term.
- ▶ If  $M$  and  $N$  are terms, so is  $(MN)$ .
  - ▶ Function application does not enforce type check

# System F

## Syntax of second order polymorphic lambda calculus

- ▶ Every variable and (type) constant is a term.
- ▶ If  $M$  is a term,  $x$  is a variable and  $s$  is a type scheme, then  $(\lambda x \in s. M)$  is a term.
- ▶ If  $M$  and  $N$  are terms, so is  $(MN)$ .
  - ▶ Function application does not enforce type check
- ▶ If  $M$  is a term and  $a$  is a type variable, then  $(\Lambda a. M)$  is a term.
  - ▶ Type abstraction

# System F

## Syntax of second order polymorphic lambda calculus

  - ▶ Type application

# System F

Example A polymorphic identity function

$$\Lambda a. \lambda x \in a. x$$

# System F

Example A polymorphic identity function

$$\Lambda a. \lambda x \in a. x$$

Two  $\beta$  rules, for two types of abstraction

# System F

Example A polymorphic identity function

$$\Lambda a. \lambda x \in a. x$$

Two  $\beta$  rules, for two types of abstraction

$$\blacktriangleright (\lambda x \in s. M) N \rightarrow_{\beta} M\{x \leftarrow N\}$$

# System F

Example A polymorphic identity function

$$\Lambda a. \lambda x \in a. x$$

Two  $\beta$  rules, for two types of abstraction

- ▶  $(\lambda x \in s. M) N \rightarrow_{\beta} M\{x \leftarrow N\}$
- ▶  $(\Lambda a. M) s \rightarrow_{\beta} M\{a \leftarrow s\}$

# System F

- ▶ System F is also strongly normalizing

# System F

- ▶ System F is also strongly normalizing
- ▶ ...but **type inference** is undecidable!
  - ▶ Given an arbitrary term, can it be assigned a sensible type?

# Type inference in System F

- ▶ Type of a complex expression can be deduced from types assigned to its parts

# Type inference in System F

- ▶ Type of a complex expression can be deduced from types assigned to its parts
- ▶ To formalize this, define a relation  $A \vdash M : s$ 
  - ▶  $A$  is list  $\{x_i : t_i\}$  of type “assumptions” for variables
  - ▶ Under the assumptions in  $A$ , the expression  $M$  has type  $s$ .

# Type inference in System F

- ▶ Type of a complex expression can be deduced from types assigned to its parts
- ▶ To formalize this, define a relation  $A \vdash M : s$ 
  - ▶  $A$  is list  $\{x_i : t_i\}$  of type “assumptions” for variables
  - ▶ Under the assumptions in  $A$ , the expression  $M$  has type  $s$ .
- ▶ Inference rules to derive type judgments of the form  $A \vdash M : s$

# Type inference in System F

## Notation

If  $A$  is a list of assumptions,  $A + \{x : s\}$  is the list where

- ▶ Assumption for  $x$  in  $A$  (if any) is overridden by the new assumption  $x : s$ .
- ▶ For any variable  $y \neq x$ , assumption does not change

# Type inference in System F

## Notation

If  $A$  is a list of assumptions,  $A + \{x : s\}$  is the list where
