

Lists \rightarrow Trees

data Tree a = Nil | Node (Tree a) a (Tree a)

Recall: list $[v_1, v_2, v_3]$

capture this unit as
a class

```
class TNode:
```

```
    def __init__(self, initval=None):
```

```
        self.value = initval
```

```
        if initval != None:
```

```
            self.left = TNode()
```

```
            self.right = TNode()
```

```
        else:
```

```
            self.left = None
```

```
            self.right = None
```

$t = \text{TNode}()$

or

$t = \text{TNode}(v)$

Insert Nil v = Node Nil v Nil

Search trees (values are ordered using \leq)

Each value is stored at most once

3 operations on search trees:

find v in t return True/False

insert v in t do nothing if v already present in t

delete v from t do nothing if v not present in t

find Nil v = False

find (Node tl x tr) v

| $v == x$ = True

| $v < x$ = find tl v

| otherwise = find tr v

```
class TNode:
```

```
    :
```

```
    def find(self, v):
```

```
        if self.value == None:
```

```
            return (False)
```

```
        if v == self.value:
```

```
            return (True)
```

```
        if v < self.value:
```

```
            return (self.left.find(v))
```

```
        else:
```

```
            return (self.right.find(v))
```

insert Nil v = node Nil v Nil

insert (Node tl x tr) v

| $v < x$ = Node (insert tl v) x tr

| $v > x$ = Node tl x (insert tr v)

| otherwise = Node tl x tr

def insert(self, v):

if self.value == None:

self.value = v

self.left = TNode()

self.right = TNode()

if v < self.value:

self.left.insert(v)

if v > self.value:

self.right.insert(v)

delete Nil $v = \text{Nil}$

delete (Node $tl\ x\ tr$) v

| $v < x = \text{Node} (\text{delete } tl\ v)\ x\ tr$

| $v > x = \text{Node } tl\ x\ (\text{delete } tr\ v)$

$x == v$ | $tl == \text{Nil} = tr$

| $tr == \text{Nil} = tl$

| otherwise = Node $tnew\ d\ tr$

where $(tnew, d) = \text{deletemax } tl$

```
def delete(self, v):
```

```
    if self.value == None:
```

```
        return
```

```
    if v < self.value:
```

```
        self.left.delete(v)
```

```
    if return v > self.value:
```

```
        self.right.delete(v)
```

```
        return
```

```
    if self.left.value == None:
```

```
        self.value = self.right.value
```

```
        self.left = self.right.left
```

```
        self.right = self.right.right
```

```
        return
```

```
    if self.right.value == None:
```

```
        self.value = self.left.value
```

```
        self.right = self.left.right
```

```
        self.left = self.left.left
```

```
        return
```

Symmetric

```
    d = self.left.deletemax()
```

```
    self.value = d
```

```
    return
```

} cannot swap these two!

$\text{deletemax}(\text{Node } tl \ x \ \text{Nil}) = (tl, x)$

$\text{deletemax}(\text{Node } tl \ x \ tr) = (\text{Node } tl \ x \ tnew, d)$

where $(tnew, d) = \text{deletemax } tr$

`def deletemax(self):`

`if self.right.value == None:`

`x = self.value`

`self.value = self.left.value`

`self.right = self.left.right`

`self.left = self.left.left`

`return(x)`

`else:`

`d = self.right.deletemax()`

`return(d)`

Balancing the tree
What is balance?

size balance

$$|\text{size}(\text{left tree}) - \text{size}(\text{right tree})| \leq 1$$

height balance

$$|\text{height}(\text{left tree}) - \text{height}(\text{right tree})| \leq 1$$

height balanced,
not size balanced

$\text{smallest}(h)$ = smallest height balanced tree of height h
nodes in

$$\text{smallest}(0) = 0$$

$$\text{smallest}(1) = 1$$

$$\text{smallest}(2) = 2$$

$$\text{smallest}(3) = 4$$

$$\vdots$$
$$\text{smallest}(h+1) = 1 + \text{smallest}(h) + \text{smallest}(h-1)$$

$$\text{smallest}(h) \geq \text{fib}(h) \quad \text{fib grows exponentially}$$
