

MPRI 2-9-1

“Algorithmic Aspects of WQO Theory”

Nov. 19th, 2020: Ideals & Generic algorithms for
downward-closed sets

SOME RECALLS FROM PREVIOUS WEEKS

Def. (X, \leq) is a **well-quasi-ordering** (a wqo) if any infinite sequence $x_0, x_1, x_2 \dots$ over X contains an increasing pair $x_i \leq x_j$ (for some $i < j$)

Examples.

1. (\mathbb{N}^k, \leq_x) is a wqo (Dickson's Lemma)
where, e.g., $(3, 2, 1) \leq_x (5, 2, 2)$ but $(1, 2, 3) \not\leq_x (5, 2, 2)$
2. (Σ^*, \leq_*) is a wqo (Higman's Lemma)
where, e.g., $abc \leq_* bacbc$ but $cba \not\leq_* bacbc$

Verification of WSTS. It is possible to decide Safety, Termination, etc., for systems with well-quasi-ordered states and monotonic (aka compatible) steps.

Today's class: *WQO-based algorithms often have to handle/reason about/.. infinite upward- or downward-closed sets*

- This is a non-trivial problem
- But there exists a **powerful & generic** approach via **ideals**

SOME RECALLS FROM PREVIOUS WEEKS

Def. (X, \leq) is a **well-quasi-ordering** (a wqo) if any infinite sequence $x_0, x_1, x_2 \dots$ over X contains an increasing pair $x_i \leq x_j$ (for some $i < j$)

Verification of WSTS. It is possible to decide Safety, Termination, etc., for systems with well-quasi-ordered states and monotonic (aka compatible) steps.

Today's class: *WQO-based algorithms often have to handle/reason about/.. infinite upward- or downward-closed sets*

- This is a non-trivial problem
- But there exists a **powerful & generic** approach via **ideals**

OUTLINE FOR TODAY

- ▶ The need for data structure and algorithms for closed subsets
- ▶ Ideals and filters : basics
- ▶ Effective ideals and filters
- ▶ The Valk-Jantzen-Goubault-Larrecq algorithm
- ▶ Building complex effective wqos from simpler ones : tuples, sequences, powersets, substructures, weakening, etc.

HANDLING UPWARD-CLOSED SUBSETS

Verifying safety for a WSTS is usually done by computing
upward-closed subsets

$$B \subseteq \text{Pre}^{\leq 1}(B) \subseteq \text{Pre}^{\leq 2}(B) \subseteq \dots \subseteq \bigcup_m \text{Pre}^{\leq m}(B) = \text{Pre}^*(B)$$

How is this implemented in practice?

Consider (\mathbb{N}^2, \leq_x) and upward-closed subsets U, U', V, \dots

$U =$

There is the finite basis presentation:

HANDLING UPWARD-CLOSED SUBSETS

Verifying safety for a WSTS is usually done by computing
upward-closed subsets

How is this implemented in practice?

Consider (\mathbb{N}^2, \leq_x) and upward-closed subsets U, U', V, \dots

$U =$

There is the finite basis presentation:

$$U = \uparrow(2,6) \cup \uparrow(4,5) \cup \uparrow(6,1) \cup \uparrow(10,0)$$

We also need algorithms for computing with this representation:

- E.g. testing whether $U \subseteq V$

HANDLING UPWARD-CLOSED SUBSETS

How is this implemented **in practice**?

Consider (\mathbb{N}^2, \leq_x) and upward-closed subsets U, U', V, \dots

$U =$

There is the **finite basis presentation**:

$$U = \uparrow(2,6) \cup \uparrow(4,5) \cup \uparrow(6,1) \cup \uparrow(10,0)$$

We also need **algorithms** for computing with this representation:

- E.g., testing whether $U \subseteq V$
- E.g., performing $U \leftarrow U \cup V$ or $U \leftarrow U \cap V$

HANDLING UPWARD-CLOSED SUBSETS

How is this implemented [in practice](#)?

Consider (\mathbb{N}^2, \leq_x) and upward-closed subsets U, U', V, \dots

$U =$

There is the [finite basis presentation](#):

$$U = \uparrow(2,6) \cup \uparrow(4,5) \cup \uparrow(6,1) \cup \uparrow(10,0)$$

We also need [algorithms](#) for computing with this representation:

- E.g., testing whether $U \subseteq V$
- E.g., performing $U \leftarrow U \cup V$ or $U \leftarrow U \cap V$

UPWARD-CLOSED SUBSETS OF (Σ^*, \leq_*)

Let us consider words with subword ordering, e.g., for lossy channel systems:

$$U = \uparrow abc \cup \dots \cup \uparrow ddca \quad V = \uparrow bb \cup \dots$$

How do we compare such sets?

How do we add to them ?

How do we remove from them ? E.g., how do we perform $U \leftarrow U \cap \uparrow cbab$ or $U \leftarrow U \setminus \downarrow bacbab$?

Bottom line: These are feasible but not trivial !

- Can we handle \mathbb{N}^k and Σ^* **efficiently** ?
- What about **other WQOs**? E.g. over $(\mathbb{N}^2)^*$: $\uparrow \left(\begin{array}{c|c} 2 & 0 \\ \hline 0 & 2 \end{array} \right) \cap \uparrow \left(\begin{array}{c|c} 1 & 1 \\ \hline 1 & 0 \end{array} \right)$

UPWARD-CLOSED SUBSETS OF (Σ^*, \leq_*)

Let us consider words with subword ordering, e.g., for lossy channel systems:

$$U = \uparrow abc \cup \dots \cup \uparrow ddca \quad V = \uparrow bb \cup \dots$$

How do we compare such sets?

How do we add to them ?

How do we remove from them ? E.g., how do we perform $U \leftarrow U \cap \uparrow cbab$ or $U \leftarrow U \setminus \downarrow baccbab$?

Bottom line: These are feasible but not trivial !

- Can we handle \mathbb{N}^k and Σ^* **efficiently** ?
- What about **other WQOs**? E.g. over $(\mathbb{N}^2)^*$: $\uparrow \left(\begin{array}{c|c} 2 & 0 \\ \hline 0 & 2 \end{array} \right) \cap \uparrow \left(\begin{array}{c|c} 1 & 1 \\ \hline 1 & 0 \end{array} \right)$

UPWARD-CLOSED SUBSETS OF (Σ^*, \leq_*)

Let us consider words with subword ordering, e.g., for lossy channel systems:

$$U = \uparrow abc \cup \dots \cup \uparrow ddca \quad V = \uparrow bb \cup \dots$$

How do we compare such sets?

How do we add to them ?

How do we remove from them ? E.g., how do we perform $U \leftarrow U \cap \uparrow cbab$ or $U \leftarrow U \setminus \downarrow bacbab$?

Bottom line: These are feasible but not trivial !

- Can we handle \mathbb{N}^k and Σ^* **efficiently** ?
- What about **other WQOs**? E.g. over $(\mathbb{N}^2)^*$: $\uparrow \left(\begin{array}{c|c} 2 & 0 \\ \hline 0 & 2 \end{array} \right) \cap \uparrow \left(\begin{array}{c|c} 1 & 1 \\ \hline 1 & 0 \end{array} \right)$

UPWARD-CLOSED SUBSETS OF (Σ^*, \leq_*)

Let us consider words with subword ordering, e.g., for lossy channel systems:

$$U = \uparrow abc \cup \dots \cup \uparrow ddca \quad V = \uparrow bb \cup \dots$$

How do we compare such sets?

How do we add to them ?

How do we remove from them ? E.g., how do we perform $U \leftarrow U \cap \uparrow cbab$ or $U \leftarrow U \setminus \downarrow baccbab$?

Bottom line: These are feasible but not trivial !

- Can we handle \mathbb{N}^k and Σ^* **efficiently** ?
- What about **other WQOs**? E.g. over $(\mathbb{N}^2)^*$: $\uparrow \left(\begin{smallmatrix} 2 \\ 0 \end{smallmatrix} \mid \begin{smallmatrix} 0 \\ 2 \end{smallmatrix} \right) \cap \uparrow \left(\begin{smallmatrix} 1 \\ 1 \end{smallmatrix} \mid \begin{smallmatrix} 1 \\ 0 \end{smallmatrix} \right)$

NOW WHAT ABOUT DOWNWARD-CLOSED SUBSETS?

Problem: downward-closed D **can't always** be represented under the form $D = \downarrow x_1 \cup \dots \cup \downarrow x_\ell$, take e.g. $D = \mathbb{N}^2$.

Recall: D can **always** be represented by **excluded minors**:

$$D = X \setminus \uparrow m_1 \setminus \uparrow m_2 \cdots \setminus \uparrow m_\ell$$

This amounts to $D = \neg U$ with $U = \uparrow m_1 \cup \dots \cup \uparrow m_\ell$.

Problem: Not very convenient for simple sets:

— How do you represent $\downarrow(2,2)$ in (\mathbb{N}^2, \leq_x) ? And $\downarrow ab$ in (Σ^*, \leq_*) ?

$$\downarrow(2,2) = \neg[\uparrow(0,3) \cup \uparrow(3,0)] \quad \downarrow ab = \neg[\uparrow ba \cup \uparrow c \cup \dots]$$

— How do you compute $D \cup D'$?

There is a better solution: **decompose into primes!**

NOW WHAT ABOUT DOWNWARD-CLOSED SUBSETS?

Problem: downward-closed D **can't always** be represented under the form $D = \downarrow x_1 \cup \dots \cup \downarrow x_\ell$, take e.g. $D = \mathbb{N}^2$.

Recall: D can **always** be represented by **excluded minors**:

$$D = X \setminus \uparrow m_1 \setminus \uparrow m_2 \cdots \setminus \uparrow m_\ell$$

This amounts to $D = \neg U$ with $U = \uparrow m_1 \cup \dots \cup \uparrow m_\ell$.

Problem: Not very convenient for simple sets:

— How do you represent $\downarrow(2,2)$ in (\mathbb{N}^2, \leq_x) ? And $\downarrow ab$ in (Σ^*, \leq_*) ?

$$\downarrow(2,2) = \neg[\uparrow(0,3) \cup \uparrow(3,0)] \quad \downarrow ab = \neg[\uparrow ba \cup \uparrow c \cup \dots]$$

— How do you compute $D \cup D'$?

There is a better solution: **decompose into primes!**

NOW WHAT ABOUT DOWNWARD-CLOSED SUBSETS?

Problem: downward-closed D **can't always** be represented under the form $D = \downarrow x_1 \cup \dots \cup \downarrow x_\ell$, take e.g. $D = \mathbb{N}^2$.

Recall: D can **always** be represented by **excluded minors**:

$$D = X \setminus \uparrow m_1 \setminus \uparrow m_2 \cdots \setminus \uparrow m_\ell$$

$$\downarrow(2,2) = \neg[\uparrow(0,3) \cup \uparrow(3,0)] \quad \downarrow ab = \neg[\uparrow ba \cup \uparrow c \cup \dots]$$

— How do you compute $D \cup D'$?

There is a better solution: **decompose into primes!**

PRIMES, UP AND DOWN

Fix (X, \leq) WQO and consider $Up(X) = \{U, U', \dots\}$ and $Down(X) = \{D, D', \dots\}$

Def. 4.1. 1. $U (\neq \emptyset)$ is (up-) prime $\stackrel{\text{def}}{\Leftrightarrow} U \subseteq (U_1 \cup U_2)$ implies $U \subseteq U_1$ or $U \subseteq U_2$.

2. $D (\neq \emptyset)$ is (down-) prime $\stackrel{\text{def}}{\Leftrightarrow} D \subseteq (D_1 \cup D_2)$ implies $D \subseteq D_1$ or $D \subseteq D_2$.

Examples: for any $x \in X$, $\uparrow x$ is up-prime and $\downarrow x$ is down-prime

Lem. 4.2. (Irreducibility)

1. U is prime iff $U = U_1 \cup \dots \cup U_n$ implies $U = U_i$ for some i

2. D is prime iff $D = D_1 \cup \dots \cup D_n$ implies $D = D_i$ for some i

Lem. 4.3. (Completeness: Prime Decompositions Exist)

1. Every $U \in Up$ is a finite union of up-primes

2. Every $D \in Down$ is a finite union of down-primes

MINIMAL PRIME DECOMPOSITIONS

Def. A prime decomposition U (or D) $= P_1 \cup \dots \cup P_n$ is **minimal**

$\stackrel{\text{def}}{\Leftrightarrow} \forall i, j : P_i \subseteq P_j$ implies $i = j$.

Thm. 4.4. Every U (or D) has a **unique minimal prime decomposition**. It is called its **canonical decomposition**

Prop. 4.8. (Primes are Filters/Ideals)

1. The up-primes of X are exactly **the** $\uparrow x$ for $x \in X$ (the principal filters)
2. The down-primes of X are exactly **the** **ideals** of X (see below)

Def. An **ideal** I of X is a non-empty directed downward-closed subset

Recall: I **directed** $\stackrel{\text{def}}{\Leftrightarrow} x, y \in I \implies \exists z \in I : x \leq z \geq y$

Example: any $\downarrow x$ is an ideal (called a **principal ideal**)

Example: If $x_1 < x_2 < x_3 \dots$ is an increasing sequence then $\bigcup_i \downarrow x_i$ is an ideal

Exercise: Let us look at $\neg U$ for our earlier $U \subseteq \mathbb{N}^2$

MINIMAL PRIME DECOMPOSITIONS

Def. A prime decomposition U (or D) $= P_1 \cup \dots \cup P_n$ is **minimal**

$\stackrel{\text{def}}{\Leftrightarrow} \forall i, j : P_i \subseteq P_j$ implies $i = j$.

Thm. 4.4. Every U (or D) has a **unique minimal prime decomposition**. It is called its **canonical decomposition**

Prop. 4.8. (Primes are Filters/Ideals)

1. The up-primes of X are exactly **the** $\uparrow x$ for $x \in X$ (the principal filters)
2. The down-primes of X are exactly **the ideals** of X (see below)

Def. An **ideal** I of X is a non-empty directed downward-closed subset

Recall: I **directed** $\stackrel{\text{def}}{\Leftrightarrow} x, y \in I \implies \exists z \in I : x \leq z \geq y$

Example: any $\downarrow x$ is an ideal (called a **principal ideal**)

Example: If $x_1 < x_2 < x_3 \dots$ is an increasing sequence then $\bigcup_i \downarrow x_i$ is an ideal

Exercise: Let us look at $\neg U$ for our earlier $U \subseteq \mathbb{N}^2$

A DOWNWARD-CLOSED SUBSET OF \mathbb{N}^2

$u =$

A DOWNWARD-CLOSED SUBSET OF \mathbb{N}^2

$$D = \neg u =$$

A DOWNWARD-CLOSED SUBSET OF \mathbb{N}^2

$$D = I_1 \cup \dots \cup I_4$$

NAILING DOWN THE IDEALS

The ideals of (\mathbb{N}, \leq) are exactly all $\downarrow n$ together with \mathbb{N} itself

Hence $(\text{Idl}(\mathbb{N}), \subseteq) \equiv (\mathbb{N} \cup \{\omega\}, \leq)$, denoted \mathbb{N}_ω ($\equiv \omega + 1$)

Thm. The ideals of $(X_1 \times X_2, \leq_x)$ are exactly the $J_1 \times J_2$ for J_i an ideal of X_i ($i = 1, 2$)

Hence $(\text{Idl}(X_1 \times X_2), \subseteq) \equiv \text{Idl}(X_1, \subseteq) \times \text{Idl}(X_2, \subseteq)$ Very nice !!!!

Coro. The ideals of (\mathbb{N}^k, \leq_x) are handled like \mathbb{N}_ω^k

Example: Assume $U = \uparrow(2, 2)$ and $D = \downarrow(4, \omega) \cup \downarrow(6, 3)$.
What is $U \setminus D$ and $D \setminus U$?

NAILING DOWN THE IDEALS

The ideals of (\mathbb{N}, \leq) are exactly all $\downarrow n$ together with \mathbb{N} itself

Hence $(\text{Idl}(\mathbb{N}), \subseteq) \equiv (\mathbb{N} \cup \{\omega\}, \leq)$, denoted \mathbb{N}_ω ($\equiv \omega + 1$)

Thm. The ideals of $(X_1 \times X_2, \leq_x)$ are exactly the $J_1 \times J_2$ for J_i an ideal of X_i ($i = 1, 2$)

Hence $(\text{Idl}(X_1 \times X_2), \subseteq) \equiv \text{Idl}(X_1, \subseteq) \times \text{Idl}(X_2, \subseteq)$ Very nice !!!!

Coro. The ideals of (\mathbb{N}^k, \leq_x) are handled like \mathbb{N}_ω^k

Example: Assume $U = \uparrow(2, 2)$ and $D = \downarrow(4, \omega) \cup \downarrow(6, 3)$.
What is $U \setminus D$ and $D \setminus U$?

NAILING DOWN THE IDEALS

The ideals of (\mathbb{N}, \leq) are exactly all $\downarrow n$ together with \mathbb{N} itself

Hence $(\text{Idl}(\mathbb{N}), \subseteq) \equiv (\mathbb{N} \cup \{\omega\}, \leq)$, denoted \mathbb{N}_ω ($\equiv \omega + 1$)

Thm. The ideals of $(X_1 \times X_2, \leq_x)$ are exactly the $J_1 \times J_2$ for J_i an ideal of X_i ($i = 1, 2$)

Hence $(\text{Idl}(X_1 \times X_2), \subseteq) \equiv \text{Idl}(X_1, \subseteq) \times \text{Idl}(X_2, \subseteq)$ Very nice !!!!

Coro. The ideals of (\mathbb{N}^k, \leq_x) are handled like \mathbb{N}_ω^k

Example: Assume $U = \uparrow(2, 2)$ and $D = \downarrow(4, \omega) \cup \downarrow(6, 3)$.
What is $U \setminus D$ and $D \setminus U$?

IDEALS FOR (Σ^*, \leq_*) ?

Recall: $\downarrow w$ is an ideal for any $w \in \Sigma^*$.

E.g. $\downarrow abc = \{abc, ab, ac, bc, a, b, c, \varepsilon\}$

What else?

- Σ^* ?
- $(ab)^* = \{\varepsilon, ab, abab, ababab, \dots\}$?
- $a^* + b^* = \{\varepsilon, a, aa, aaa, \dots, b, bb, bbb, \dots\}$?
- $(a + b)^*$?

Lem. $I \cdot J \in \text{Idl}(\Sigma^*)$ for all $I, J \in \text{Idl}(\Sigma^*)$

Thm. The ideals of Σ^* are exactly the concatenation products

$P = A_1 \cdot A_2 \cdots A_n$ for atoms of the form $A = \downarrow a = \{a, \varepsilon\}$ with $a \in \Sigma$ or $A = \Gamma^*$ with $\Gamma \subseteq \Sigma$.

Exercise. Use this to compute $\Sigma^* \setminus \uparrow bad$

IDEALS FOR (Σ^*, \leq_*) ?

Recall: $\downarrow w$ is an ideal for any $w \in \Sigma^*$.

(OR): \leq is decidable over X

(IR): $Idl(X)$ is recursive

(II): \subseteq is decidable over $Idl(X)$

(CF): $F = \uparrow x \mapsto \neg F = X \setminus F = I_1 \cup \dots \cup I_n$ is recursive

(CI): $I \mapsto \neg I = \uparrow x_1 \cup \dots \cup \uparrow x_n$ is recursive

(IF) & (II): $F_1, F_2 \mapsto F_1 \cap F_2 = \uparrow x_1 \cup \dots$ and $I_1, I_2 \mapsto I_1 \cap I_2 = J_1 \cup \dots$
are recursive

(IM): membership $x \in I$ is decidable over X and $Idl(X)$

(XF) & (XI): $X = F_1 \cup \dots \cup F_n$ and $X = I_1 \cup \dots \cup I_m$ are effective

(PI): $x \mapsto \downarrow x$ is recursive

Proof. Then we get (IF) from (CD) and (CI), by expressing intersection as dual of union, (IM) from (PI) and (II), (XF) from (CD) by computing $\neg \emptyset$

VALK-JANTZEN-GOUBAULT-LARRECQ ALGORITHM

(XR): X is recursive

(OR): \leq is decidable over X

(IR): $Idl(X)$ is recursive

(II): \subseteq is decidable over $Idl(X)$

(CF): $F = \uparrow x \mapsto \neg F = X \setminus F = I_1 \cup \dots \cup I_n$ is recursive

(CI): $I \mapsto \neg I = \uparrow x_1 \cup \dots \cup \uparrow x_n$ is recursive

(IF) & (II): $F_1, F_2 \mapsto F_1 \cap F_2 = \uparrow x_1 \cup \dots$ and $I_1, I_2 \mapsto I_1 \cap I_2 = J_1 \cup \dots$
are recursive

(IM): membership $x \in I$ is decidable over X and $Idl(X)$

(XF) & (XI): $X = F_1 \cup \dots \cup F_n$ and $X = I_1 \cup \dots \cup I_m$ are effective

(PI): $x \mapsto \downarrow x$ is recursive

Thm [Halfon]. There are no more redundancies in the blue axioms

CONSTRUCTING IDEALLY EFFECTIVE WQOs

- $(X \times Y, \leq_x)$ is ideally effective when X and Y are.
- (X^*, \leq_*) is ideally effective when X is. The ideals are the products of atoms $A = D^*$ for $D \in \text{Down}(X)$ and $A = \downarrow I$ for $I \in \text{Idl}(X)$
- $(X \sqcup Y, \leq_{\sqcup})$ is ideally effective when X and Y are.
 $\text{Idl}(X \sqcup Y) \equiv \text{Idl}(X) \sqcup \text{Idl}(Y)$.
- $X \times_{\text{lex}} Y$ and $X \sqcup_{\text{lex}} Y$ are ideally effective when ..
- $\mathcal{P}_f(X)$ and $\mathcal{M}_f(X)$ and (X^*, \leq_{st}) and ... are ideally ..
- $\mathcal{T}(X)$ is ideally effective when X is but the ideals are more complex (see Goubault-Larrecq & Schmitz, ICALP 2016)

CONSTRUCTING MORE IDEALLY EFFECTIVE WQOS

1. Assume (X, \leq') is an extension of (X, \leq) , i.e., $\leq \subseteq \leq'$.

Then $Idl(X, \leq') = \{\downarrow_{\leq'} I \mid I \in Idl(X, \leq)\}$.

Furthermore (X, \leq') is ideally effective when (X, \leq) is and the functions

$$I \mapsto \downarrow_{\leq'} I = I_1 \cup \dots \cup I_\ell \quad \text{and} \quad \uparrow x = F \mapsto \uparrow_{\leq'} F = \uparrow x_1 \cup \dots \cup \uparrow x_m$$

are recursive.

Example. Subwords *cum* conjugacy:

$$abcd \leq_Q acbadbbdbbdbadbc$$

Example. Quotienting (X, \leq) by some equivalence \approx such that $\approx \circ \leq = \leq \circ \approx$

CONSTRUCTING MORE IDEALLY EFFECTIVE WQOS

1. Assume (X, \leq') is an extension of (X, \leq) , i.e., $\leq \subseteq \leq'$.

Then $Idl(X, \leq') = \{\downarrow_{\leq'} I \mid I \in Idl(X, \leq)\}$.

Furthermore (X, \leq') is ideally effective when (X, \leq) is and the functions

$$I \mapsto \downarrow_{\leq'} I = I_1 \cup \dots \cup I_\ell \quad \text{and} \quad \uparrow x = F \mapsto \uparrow_{\leq'} F = \uparrow x_1 \cup \dots \cup \uparrow x_m$$

are recursive.

Example. Subwords *cum* conjugacy:

$$abcd \leq_Q acbadbbdbbdbabc$$

Example. Quotienting (X, \leq) by some equivalence \approx such that

$$\approx \circ \leq = \leq \circ \approx$$

CONSTRUCTING MORE IDEALLY EFFECTIVE WQOS

2. Assume (Y, \leq_Y) is a subwqo of (X, \leq_X) , i.e., $Y \subseteq X$ and $\leq_Y = \leq_X \cap Y \times Y$.

Then $Idl(Y, \leq) = \{I \cap Y \mid I \in Idl(X) \text{ st. } I \subseteq \downarrow_X Y \wedge I \cap Y \neq \emptyset\}$.

Furthermore (Y, \leq) is ideally effective when (X, \leq) is and when Y and the functions

$$\begin{array}{l} Idl(X) \rightarrow Down(X) \\ I \mapsto \downarrow_X(I \cap Y) = I_1 \cup \dots \cup I_\ell \end{array} \quad \text{and} \quad \begin{array}{l} Fil(X) \rightarrow Up(X) \\ \uparrow_X = F \mapsto \uparrow_X(F \cap Y) = \uparrow_{X_1} \cup \dots \cup \uparrow_{X_m} \end{array}$$

are recursive.

Example. (L, \leq_*) for a context-free $L \subseteq \Sigma^*$.

Example. Decreasing sequences in \mathbb{N}^* with the subsequence ordering.

CONSTRUCTING MORE IDEALLY EFFECTIVE WQOS

2. Assume (Y, \leq_Y) is a subwqo of (X, \leq_X) , i.e., $Y \subseteq X$ and $\leq_Y = \leq_X \cap Y \times Y$.

Then $Idl(Y, \leq) = \{I \cap Y \mid I \in Idl(X) \text{ st. } I \subseteq \downarrow_X Y \wedge I \cap Y \neq \emptyset\}$.

Furthermore (Y, \leq) is ideally effective when (X, \leq) is and when Y and the functions

$$\begin{array}{l} Idl(X) \rightarrow Down(X) \\ I \mapsto \downarrow_X(I \cap Y) = I_1 \cup \dots \cup I_\ell \end{array} \quad \text{and} \quad \begin{array}{l} Fil(X) \rightarrow Up(X) \\ \uparrow_X = F \mapsto \uparrow_X(F \cap Y) = \uparrow_{X_1} \cup \dots \cup \uparrow_{X_m} \end{array}$$

are recursive.

Example. (L, \leq_*) for a context-free $L \subseteq \Sigma^*$.

Example. Decreasing sequences in \mathbb{N}^* with the subsequence ordering.

CONCLUSION FOR PART V

Ideal-based algorithms already have several applications.

Handling WQO's raise many interesting algorithmic questions:

- Best algorithms for (Σ^*, \leq_*) ? (Karandikar et al., TCS 2016)
- Best algorithms for $(\mathbb{N}^k)^*$?
- Fully generic library of data structures and algorithms?
- Separating the polynomial and the exponential cases?
- More constructions .. Beyond WQOs ..
- ...
